

## كد ماشين هوشمند

```
import time
حالات ماشين #
states = [
    "Start",
    "Scan for Obstacles",
    "Move Forward",
    "Turn Left",
    "Turn Right",
    "Slow Down",
    "Stop",
    "Reverse",
    "Path Clear",
    "Obstacle Ahead"
توابع برای هر حالت #
def start():
   print("Initializing system...")
   time.sleep(1)
    return "Scan for Obstacles"
def scan_for_obstacles():
    print("Scanning for obstacles...")
    time.sleep(1)
    شبیهسازی نتیجه اسکن #
    obstacle_detected = input("Obstacle detected? (yes/no): ").lower()
    if obstacle_detected == "no":
        return "Path Clear"
    else:
        return "Obstacle Ahead"
def move_forward():
   print("Path is clear. Moving forward...")
    time.sleep(1)
    return "Scan for Obstacles"
def turn_left():
    print("Obstacle detected. Turning left...")
    time.sleep(1)
   return "Scan for Obstacles"
def turn_right():
   print("Obstacle detected. Turning right...")
   time.sleep(1)
   return "Scan for Obstacles"
def slow_down():
   print("Narrow path ahead. Slowing down...")
   time.sleep(1)
   return "Scan for Obstacles"
def stop():
   print("Stopping the car...")
   time.sleep(1)
   return "Start"
```

```
def reverse():
    print("Reversing to avoid obstacle...")
    time.sleep(1)
    return "Scan for Obstacles"
def path_clear():
    print("Path clear. Proceeding safely...")
    time.sleep(1)
    return "Move Forward"
def obstacle_ahead():
    print("Obstacle detected ahead. Making a decision...")
    time.sleep(1)
    decision = input("Choose action (left/right/reverse/stop): ").lower()
    if decision == "left":
       return "Turn Left"
    elif decision == "right":
        return "Turn Right"
    elif decision == "reverse":
       return "Reverse"
    elif decision == "stop":
       return "Stop"
    else:
       print("Invalid decision. Stopping...")
        return "Stop"
نگاشت وضعیتها به توابع #
state_functions = {
    "Start": start,
    "Scan for Obstacles": scan_for_obstacles,
    "Move Forward": move_forward,
    "Turn Left": turn_left,
    "Turn Right": turn_right,
    "Slow Down": slow_down,
    "Stop": stop,
    "Reverse": reverse,
    "Path Clear": path_clear,
    "Obstacle Ahead": obstacle_ahead
اجرای شبیهسازی #
def main():
    current_state = "Start"
   while True:
       print(f"Current State: {current_state}")
       current_state = state_functions[current_state]()
if __name__ == "__main__":
    main()
```

## نحوه کارکرد:

- این کد یک سیستم ساده برای تغییر وضعیت ماشین هوشمند شبیهسازی میکند.
  - ورودیها به صورت دستی (کاربر) وارد میشوند تا وضعیت محیط مشخص شود.

## بهبودهای ممکن:

- میتوانید از دادههای واقعی سنسور و مدلهای یادگیری ماشینی (با استفاده از OpenCV و یادگیری ماشینی (با استفاده کنید. TensorFlow) برای تصمیمگیری خودکار استفاده کنید.
- با ترکیب جدول و نمودار، الگوریتمهای پیشرفتهتری
   پیادهسازی کنید.
